A unique concept to replace lumbar and cervical discs and preserve spinal motion
### The cervical prosthesis
- Heights from 5mm to 7mm
- Improved stability thanks to its anatomical design and spikes
- Easy and fast implantation
- Benefits from over 10 years of development
- 6 degrees of freedom
- Adaptive center of rotation
- No surface bearing for increased lifetime
- Improved stability
- Shock absorbing

### The lumbar prosthesis
- Over 10 years of research and development
- 10 years of follow up (since 2004)
- 6° of freedom
- Primary stability thanks to spikes allowing the prosthesis to be implanted anteriorly as well as antero-laterally and to face difficult soft tissue situations
- Adaptive center of rotation
- No surface bearing for an increased lifetime
- Improved stability
- Shock absorbing
- Designed to fit and restore patient lordosis

### The ESP disc prosthesis is made of 2 titanium alloy end-plates and an elastomeric cushion. The spikes on the end-plates outer surfaces improve primary fixation. The combination of a hydroxyapatite (HA) coating on top of a T40 rough surface are considered as one of the best existing coating insuring good bony fixation over time. The titanium alloy used for the end plates allows clear medical imaging.

### Designed to reproduce natural properties

</table>

### A monobloc total that restores

### Disc prosthesis natural disc functions

- Between the 2 titanium end-plates the elastomeric parts are injected for controlled resistance to compression, flexion and rotation. These elastomeric parts are concentric and their fixation prohibits micro motion. The materials used for the implants have been tested for biocompatibility according to the ISO standard 10993.
- Minimally invasive anterior approach which allows reduced hospital stay and improves rehabilitation
- LP-ESP tested up to 40 million cycles
- ESP should give a significant reduction in pain severity, re-establish lumbar curvature and natural disc functions
- ESP allows quick return to normal daily activities

- Designed to fit and restore patient lordosis
The CP-ESP cervical disc prosthesis is designed for specific indications detailed in the sales literature, such as:
Symptomatic cervical discopathy, defined as (radicular) pain and/or a functional/neurological deficit in the neck the arm with at least one of the following pathologies confirmed by imaging (computerised tomography, MRI or radiography) and having resisted medical treatment for at least 6 months.
- Herniated nucleus pulposus
- Spondylitis (defined by the presence of osteophytes)
- Radicular compression
- Discal hernia
- Nerve compression

(except for excluded hernias)
